

CREATING SECURE PASSWORDS PASSPHRASES

90% of successful cyber attacks start with a phishing email, let's prevent that

Password are a pass, passphrases are stronger

It's easy to crack a password, but passphrases are easier for humans to remember and harder for a machine to crack.

Make your passphrase tough to crack

Strong passphrases have four or more random words, at least 15 characters total, and use a mix of unrelated words is far more unpredictable.

Don't repeat passphrases for different accounts

The more the same passphrase is used, the less secure it becomes. Add in a modifier for each one based on the service that it relates to.

Consider using password managers

Not all password managers are the same, research first to see if they are from a reputable company.

Even the password manager needs a strong passphrase to protect your other passphrases from being cracked.
